Education

The University of Adelaide **Australia**
Bachelor of Computer Science, GPA: 6.5/7.0 *2022 Jan – 2024 Dec*

Experience

Global Technology Integrator Ltd. **Hong Kong**
System Engineer *2021 Aug – 2021 Nov*
I spearheaded the automation of our tasks using BAT scripts, including the migration of local accounts to AD accounts and modification of the registry, which enabled parallelization and reduced the human resources needed. Although the original scope of my job was only to do these tasks manually, my efforts to automate them were still greatly appreciated by my supervisors and colleagues as we would not have been able to finish the project on time due to the staff shortage.

Projects

The Sound of Personality (UNIHACK 2023) **Australia**
JavaScript, Spotify API *2023 Mar – 2023 Mar*
This is my first hackathon, and also my first time using APIs. Our team was a bit disorganized at first as we had no prior experience with hackathons, but we managed make it able to analyze a person's Spotify listening history and estimate their Myers-Briggs personality type.

Negative Base Converter **Australia**
HTML, CSS, JavaScript *2022 Nov – Present*
This is a web app that converts numbers from any base to any other base, including negative bases, which have the unique property of being able to represent all positive and negative integers without using a negative sign. As this topic is not very popular, I had to do a lot of research in order to discover an algorithm that can deal with the conversion properly especially when it comes to fractional numbers.

Pokemon Battles **Australia**
C++, Make, LaTeX *2022 Sep – 2022 Oct*
My team and I created a text-based, turn-based, player vs. computer Pokemon battle game. The player can choose from a selection of Pokemon and battle against a computer-controlled opponent. I led the coding part of the project, and since my teammates were not as familiar with C++, I often tried to help them learn some of the more difficult concepts and helped them succeed in this course even outside of this project.

allRGB **Hong Kong**
Python, Pillow *2021 Sep – 2021 Dec*
This is part of a bigger project started by "deidee", which has the objective to create images with one pixel for every RGB color, without any duplicate or missing colors. I aimed to create a Python program that would take any image and convert it into an allRGB image. As this was my first programming project ever, my program used the brute-force solution, and although functional, it was quite inefficient. Now that I am more familiar with algorithm design and data structures, I plan to rewrite the program to make it more efficient.

Community involvement

The Computer Science Club at The University of Adelaide **Australia**
Committee Member *2022 Dec – Present*
As a committee member, I initiated the process of updating the club's website in order to provide up-to-date information regarding our events for our members, which taught me some web development skills.

Skills & Achievements

Languages

Proficient: C++ **Intermediate / Beginner**: Bash, C, CSS, HTML, JS, LaTeX, MATLAB, Python

Prizes

Subject prize: ICT 2021 *Achiever of the best results amongst peers*

Scholarships

University of Adelaide: 30% Global Citizens Scholarship *Best possible scholarship for international students*
